Project Architecture: Component Communication

The enterprise platform uses Wazuh for detection, a backend for governance and automation, PostgreSQL for traceability, Ansible/AWX and Microsoft Graph for controlled remediation, then Wazuh again for verification.

Communication Flow

1. Agents collect inventory and logs 2. Backend queries Wazuh API 3. PostgreSQL stores assets, CVEs, jobs and audit history
4. Backend launches approved remediation 5. Engines correct endpoints 6. Wazuh rescans and confirms the result

user/API traffic — Wazuh detection and security data — remediation execution — verification loop
